Introduction lamental Concepts

Recap

Previously...

A quick review / crash course in basic linear algebra:

- Vectors: Transpose, Addition & Subtraction
- Matrix-Vector Product
- Vandermonde Matrix ... and Linear Least Squares Problems
- Matrix-Matrix Product
- Transpose of a Matrix (A^T)
- Range and Nullspace of a Matrix A

Peter Blomgren (blomgren@sdsu.edu)

- Rank of a Matrix $A_{m \times n}$
- Inverse of a Matrix A

Now...

...More Fundamental Concepts

The **Transpose** (Adjoint) a.k.a **Hermitian** (Transpose, or Conjugate) of a matrix $A \in \mathbb{C}^{m \times n}$...

For a scalar $z \in \mathbb{C}$, z = a + bi, the **complex conjugate** \overline{z} , or z^* is obtained by negating the imaginary part, *i.e.* $z^* = a - bi$.

Note that if $z \in \mathbb{R}$, then $z^* = z$.

For a matrix $A \in \mathbb{C}^{m \times n}$, the Hermitian Conjugate $A^* \in \mathbb{C}^{n \times m}$ is the matrix

$$A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \\ a_{31} & a_{32} \\ a_{41} & a_{42} \end{bmatrix} \quad \Rightarrow \quad \mathbf{A}^* = \begin{bmatrix} a_{11}^* & a_{21}^* & a_{31}^* & a_{41}^* \\ a_{12}^* & a_{22}^* & a_{32}^* & a_{42}^* \end{bmatrix}$$

The Inner Product of Two Vectors

a.k.a the dot product

The Euclidean **inner product**, denoted $\langle \vec{x}, \vec{y} \rangle$, of two column vectors $\vec{x}, \vec{y} \in \mathbb{C}^m$ is defined

$$\langle \vec{x}, \vec{y} \rangle = \vec{x}^* \vec{y} = \sum_{i=1}^m x_i^* y_i$$

note that the inner product is a scalar quantity.

The **Euclidean length**, $\|\vec{x}\|$, of $\vec{x} \in \mathbb{C}^m$ is defined

$$\|\vec{\mathbf{x}}\| = \sqrt{\langle \vec{\mathbf{x}}, \vec{\mathbf{x}} \rangle} = \sqrt{\vec{\mathbf{x}}^* \vec{\mathbf{x}}} = \sqrt{\sum_{i=1}^m |x_i|^2}$$

The Hermitian Conjugate

If $A = A^*$, the matrix A is said to be **Hermitian**.

Note that a **Hermitian matrix must be square**.

In the case that A is real-valued, *i.e.* $A \in \mathbb{R}^{m \times n}$, then $A = A^* = A^T$ (the Hermitian conjugate equals the **transpose**).

If $A = A^T$, the matrix A is said to be **Symmetric**.

Our book (TREFETHEN-BAU) tends to state results and theorems in terms of complex vectors and matrices, and hence use the Hermitian conjugate, *i.e.* \vec{x}^* is a row-vector.

The advantage of this approach is that we are able to state the most general results.

Note: There are some differences in regards to properties over \mathbb{R}^n and \mathbb{C}^n ; those gory details are explored in $\left[\mathrm{MATH}\,524\right]$

Inner Product: Geometrical Interpretation

The inner product can also be written

$$\langle \vec{x}, \vec{y} \rangle = \vec{x}^* \vec{y} = ||\vec{x}|| \cdot ||\vec{y}|| \cdot \cos(\alpha)$$

where α is the angle between \vec{x} and \vec{y}

Inner Product: Properties

Bi-Linearity

The inner product is **bilinear**, i.e. it is linear in each argument separately:

- (1) $(\vec{x}_1 + \vec{x}_2)^* \vec{y} = \vec{x}_1^* \vec{y} + \vec{x}_2^* \vec{y}$
- (2) $\vec{x}^* (\vec{y}_1 + \vec{y}_2) = \vec{x}^* \vec{y}_1 + \vec{x}^* \vec{y}_2$
- (3) $(\alpha \vec{x})^* (\beta \vec{y}) = \alpha^* \beta \vec{x}^* \vec{y}$

where \vec{x} , \vec{x}_1 , \vec{x}_2 , \vec{y} , \vec{y}_1 , $\vec{y}_2 \in \mathbb{C}^m$, and α , $\beta \in \mathbb{C}$.

Compare: Bilinearity of the matrix-vector product. The Euclidean inner product is really "just" a particular application/interpretation of the matrix-vector product.

3. Orthogonal Vectors, Matrices and Norms

Fundamental Concepts

Transpose (Adjoint) / Hermitian Inner Products, Matrix Properties, Orthogonality Unitary Matrices, Vector Norms, Matrix Norms

Orthogonal and Orthonormal Vectors

Two vectors are **orthogonal** if and only if $\langle \vec{x}, \vec{y} \rangle = \vec{x}^* \vec{y} = 0$,

$$0 = \frac{\vec{x}^* \vec{y}}{\|\vec{x}\| \cdot \|\vec{y}\|} = \cos(\alpha) \iff \alpha = \pi/2 + k \cdot \pi, \ k \in \mathbb{Z}.$$

A **set** of **non-zero** vectors *S* is **orthogonal** if its elements are pairwise orthogonal, i.e.

$$\forall \vec{x}, \vec{y} \in S, \quad \vec{x} \neq \vec{y} \quad \Rightarrow \quad \vec{x}^* \vec{y} = 0$$

A set of vectors S is orthonormal if it is orthogonal, and $\forall \vec{x} \in S$, $\|\vec{x}\| = 1$, *i.e.* all vectors are **unit-vectors**.

Associated Matrix Properties

For any two matrices A and B, of compatible dimensions, i.e. $A \in \mathbb{C}^{m \times n}$, and $B \in \mathbb{C}^{n \times k}$ the following holds

$$(AB)^* = B^*A^*$$

If the matrices A and B are square, and invertible, the following holds

$$(AB)^{-1} = B^{-1}A^{-1}$$

When necessary, we use the notation A^{-*} for $(A^*)^{-1} \equiv (A^{-1})^*$.

Question: What is $(AB)^{-*}$ (when well-defined)?

Peter Blomgren (blomgren@sdsu.edu)

3. Orthogonal Vectors, Matrices and Norms

Introduction **Fundamental Concepts**

Transpose (Adjoint) / Hermitian Inner Products, Matrix Properties, Orthogonality Unitary Matrices, Vector Norms, Matrix Norms

Linear Independence of Orthogonal Set

Theorem (Linear Independence)

The vectors in an orthogonal set S are linearly independent.

Proof (Linear Independence of Orthogonal Vectors)

Peter Blomgren (blomgren@sdsu.edu)

If the vectors in S are not independent, then $\exists \vec{v_k} \in S : \vec{v_k} \neq \vec{0}$, so that

$$\vec{v}_k = \sum_{i \neq k} c_i \vec{v}_i$$

Since $\vec{v}_k \neq 0$, $\langle \vec{v}_k, \vec{v}_k \rangle > 0$, now we use the bi-linearity property of inner products, and the orthogonality of S:

$$0 < \langle \vec{v}_k, \vec{v}_k \rangle = \left\langle \vec{v}_k, \sum_{i \neq k} c_i \vec{v}_i \right\rangle = \sum_{i \neq k} c_i \underbrace{\langle \vec{v}_k, \vec{v}_i \rangle}_{0 \ \forall i \neq k} = 0.$$

This contradicts the assumption that the vectors are linearly dependent, hence proving the theorem.

Corollary: Basis for \mathbb{C}^m

Corollary

If an orthogonal set $S \subseteq \mathbb{C}^m$ contains m vectors, then it is a basis for \mathbb{C}^m .

We can write any vector $\vec{v} \in \mathbb{C}^m$ as a unique linear combination

The computation of $a_i \vec{s_i}$ is a **projection** of \vec{v} onto the direction $\vec{s_i}$.

We can use this in order to decompose arbitrary vectors into orthogonal components...

Peter Blomgren (blomgren@sdsu.edu)

Orthogonal Vector Components

2 of 3

We see that by applying this procedure, we have decomposed the vector \vec{v} into (n+1) orthogonal components:

$$\vec{v} = \vec{r} + \sum_{i=1}^{n} \langle \vec{q}_i, \vec{v} \rangle \vec{q}_i$$

If $\{\vec{q}_i\}$ is a basis for \mathbb{C}^m , then n=m and $\vec{r}=\vec{0}$, *i.e.*

$$\vec{v} \stackrel{!}{=} \sum_{i=1}^{n} \langle \vec{q}_i, \vec{v} \rangle \vec{q}_i = \sum_{i=1}^{n} (\vec{q}_i^* \vec{v}) \vec{q}_i = \sum_{i=1}^{n} \vec{q}_i (\vec{q}_i^* \vec{v}) = \sum_{i=1}^{n} (\vec{q}_i \vec{q}_i^*) \vec{v}$$

Orthogonal Vector Components

Suppose we have an **orthonormal set** of vectors $\{\vec{q}_1, \vec{q}_2, \ldots, \vec{q}_n\}$, $\vec{q}_i \in \mathbb{C}^m$, $n \leq m$.

Now, for any vector $\vec{v} \in \mathbb{C}^m$, the vector

$$\vec{r} = \vec{v} - \sum_{i=1}^{n} \langle \vec{q}_i, \vec{v} \rangle \vec{q}_i$$

is orthogonal to $\{\vec{q}_1, \vec{q}_2, \ldots, \vec{q}_n\}$:

$$\langle \, ec{q}_k, \, ec{r} \,
angle = \langle \, ec{q}_k, \, ec{v} \,
angle - \underbrace{\sum_{i=1}^n \langle \, ec{q}_i, \, ec{v} \,
angle \langle \, ec{q}_k, \, ec{q}_i \,
angle}_{1} = 0.$$

Orthogonal Vector Components

$$ec{v} = \sum_{i=1}^n \langle \, ec{q}_i, \, ec{v} \,
angle ec{q}_i = \sum_{i=1}^n ig(ec{q}_i^* ec{v} ig) ec{q}_i = \sum_{i=1}^n ec{q}_i ig(ec{q}_i^* ec{v} ig) = \sum_{i=1}^n ig(ec{q}_i ec{q}_i^* ig) ec{v}$$

In the expression $\sum_{i=1}^{n} (\vec{q}_{i}^{*}\vec{v})\vec{q}_{i}$ we view \vec{v} as a linear combination of the vectors \vec{q}_{i} , with coefficients $(\vec{q}_{i}^{*}\vec{v})$; whereas in the mathematically equivalent expression $\sum_{i=1}^{n} (\vec{q}_{i}\vec{q}_{i}^{*})\vec{v}$, we view \vec{v} as a sum of **orthogonal projections** onto the various directions \vec{q}_{i} .

We will return to the issue of projection matrices of the formed by other products, $\vec{q}_i \vec{q}_i^*$ soon.

Unitary Matrices

A square matrix $Q \in \mathbb{C}^{m \times m}$ is unitary (in the real case "orthogonal") if

$$Q^* = Q^{-1} \quad \Leftrightarrow \quad Q^*Q = I$$

In terms of the columns, \vec{q}_i of Q this looks like

We have $\vec{q}_i^* \vec{q}_i = \delta_{ii}$, the **Kronecker delta**, equal to 1 if and only if i = i, and 0 otherwise.

Peter Blomgren (blomgren@sdsu.edu)

3. Orthogonal Vectors, Matrices and Norms

Fundamental Concepts

Inner Products, Matrix Properties, Orthogonality Unitary Matrices, Vector Norms, Matrix Norms

Vector Norms

Norms give us the essential notion of size and distance in a vector space — these are our tools for measuring the quality of approximations and convergence in our algorithms.

Definition (Norm)

A **norm** is a function $\|\cdot\|:\mathbb{C}^m\to\mathbb{R}$ that assigns a real-valued (length) to each vector. A norm must satisfy the following three conditions for all vectors $\vec{x}, \vec{y} \in \mathbb{C}^m$, and scalars $\alpha \in \mathbb{C}$,

- $\|\vec{x}\| > 0$, and $\|\vec{x}\| = 0$ only if $\vec{x} = 0$
- (2) $\|\vec{x} + \vec{y}\| < \|\vec{x}\| + \|\vec{y}\|$
- $\|\alpha \vec{\mathbf{x}}\| = |\alpha| \|\vec{\mathbf{x}}\|$
- (2) is known as the "triangle inequality."

Multiplication by a Unitary Matrix

Since the norms of the columns of a unitary matrix are 1, multiplication by a unitary matrix preserves the Euclidean norm, and inner product in the following sense:

For a unitary Q:

1)
$$\langle Q\vec{x}, Q\vec{y} \rangle = (Q\vec{x})^*(Q\vec{y}) = \vec{x}^* \underbrace{Q^*Q}_{l} \vec{y} = \vec{x}^* \vec{y} = \langle \vec{x}, \vec{y} \rangle$$

$$(2) \qquad \|Q\vec{x}\| = \|\vec{x}\|$$

The invariance of inner products mean that angles between vectors are preserved.

In the real case, multiplication by an orthogonal matrix corresponds to a rigid rotation (if det(Q) = 1) or a combined **rotation** – **reflection** (if det(Q) = -1) of the vector space.

3. Orthogonal Vectors, Matrices and Norms

— (18/29)

Introduction **Fundamental Concepts** Unitary Matrices, Vector Norms, Matrix Norms

The *p*-norms

The p-norms (sometimes referred to as the ℓ_p -norms), parametrized by p are defined by

$$\|\vec{x}\|_p = \left[\sum_{i=1}^m |x_i|^p\right]^{1/p}$$

As an illustration, the **unit sphere** $\|\vec{x}\|_p = 1$, $\vec{x} \in \mathbb{R}^2$ is illustrated for some common (and uncommon) p-norms, on the following slides.

2-norm the standard Euclidean length function.

Peter Blomgren (blomgren@sdsu.edu)

1-norm sometimes referred to as the Manhattan/taxicab-distance.

0-norm counts the number of non-zero elements in a vector.

3. Orthogonal Vectors, Matrices and Norms

- (21/29)

Fundamental Concepts

Inner Products, Matrix Properties, Orthogonality Unitary Matrices, Vector Norms, Matrix Norms

Weighted p-norms

1 of 3

The **weighted** *p***-norms** $\|\cdot\|_{W,p}$ are derived from the *p*-norms:

$$\|\vec{x}\|_{W,p} = \|W\vec{x}\|_{p}$$

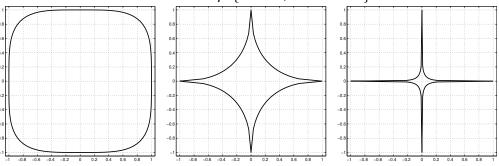

where W is e.g. a diagonal matrix, in which the ith diagonal entry is the weight $w_i \neq 0$:

$$\|\vec{x}\|_{W,p} = \left[\sum_{i=1}^{m} |w_i x_i|^p\right]^{1/p}$$

The p-norms

$$\|\vec{x}\|_4 = \left[\sum_{i=1}^m |x_i|^4\right]^{1/4}, \quad \|\vec{x}\|_{1/2} = \left[\sum_{i=1}^m |x_i|^{1/2}\right]^2, \quad \|\vec{x}\|_{1/4} = \left[\sum_{i=1}^m |x_i|^{1/4}\right]^4$$

Note: when p < 1 the "norms" are not convex; which means the triangle inequality will not hold; and strictly speaking these are not norms... ∃ Movie.

Illustration: Matrix Norms

$$A = \left[egin{array}{ccc} 1 & 2 \ 1/3 & 2 \end{array}
ight], \qquad \lambda(A) &= \{2.45743, 0.54257\} \ \sigma(A) &= \{2.98523, 0.44664\} \
ight. ext{ singular values}$$

Matrix Norms — Induced by Vector Norms

Given a vector norms $\|\cdot\|_{(m)}$ and $\|\cdot\|_{(n)}$ on the domain and range of $A \in \mathbb{C}^{m \times n}$, the induced matrix norm $\|A\|_{(m,n)}$ is

$$||A||_{(m,n)} = \sup_{\vec{x} \in \mathbb{C}^n - \{\vec{0}\}} \left[\frac{||A\vec{x}||_{(m)}}{||\vec{x}||_{(n)}} \right]$$

In any sane application, both $\|\cdot\|_{(m)}$ and $\|\cdot\|_{(n)}$ will be of the same type, *i.e.* the *p*-norms (with the same *p*).

Due to the linearity of norms — the third norm-condition — it is sufficient to maximize the matrix norm over $\vec{x} \in \mathbb{C}^n : ||\vec{x}|| = 1...$

Most of the time the norms with p=2 are used. Indeed, if nothing else is specified, this is usually implied.

Peter Blomgren (blomgren@sdsu.edu)

3. Orthogonal Vectors, Matrices and Norms

ns — (26/29)

Introduction Fundamental Concepts Next... Transpose (Adjoint) / Hermitian Inner Products, Matrix Properties, Orthogonali Unitary Matrices, Vector Norms, Matrix Norms

Special Cases: Matrix p-norms

If D is a diagonal matrix, then

$$||D||_p = \max_{1 \le i \le m} |d_i|.$$

The 1-norm of a matrix is the maximal column-abs-sum:

$$||A||_1 = \max_{1 \le j \le n} ||\vec{a}_j||_1$$

The ∞ -norm of a matrix is the maximal row-abs-sum:

Peter Blomgren (blomgren@sdsu.edu)

$$||A||_{\infty} = \max_{1 \le i \le m} ||\bar{a}_i^*||_1$$
